Document on Data Selection for the Information Retrieval Project

In the context of this Information Retrieval (IR) project, the goal is to develop a method for retrieving and analyzing relevant information from a dataset. One of the key steps in the project is data selection. In this context, I have chosen to work with cooking recipes, particularly breakfast and dessert recipes, from the website "All Recipes." This choice is motivated by my personal interest in cooking and my desire to explore how an IR system can be used to search for recipes based on ingredients, dish types, and other criteria.

Data Selection

I selected a corpus consisting of cooking recipes available on the "All Recipes" website:

- **Type of Documents**: Breakfast and dessert cooking recipes.
- **136 recipes** were selected based on their diversity to cover a wide range of recipes.
